TRADITIONAL VISION CARE

Vision & Sensory Integration

TRADITIONAL VISION CARE AND BEYOND...

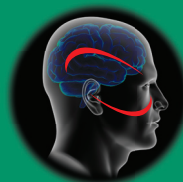

We go beyond the Traditional Vision Care and assess the function of the “whole” visual system in an innovative way that allows better Vision and Sensory Integration.

AND BEYOND...

Connecting Vision & Body

VSI assesses both visions under more natural conditions ↻

Traditional testing excludes peripheral vision ↻

The “whole” Visual System - Central & Peripheral Vision

Central Vision is the middle part of the visual field. It provides information for “What is it?” and allows us to identify objects.

Peripheral Vision is all that is visible to the eye outside the central area of focus, it provides information for “Where Am I/ Where is it?” and is directly linked to posture, balance and movement.

VSI assesses both visions under more natural conditions. Traditional testing excludes peripheral vision.

How can VSI help you?

Prevent vision and eye problems from developing.

Provide vision improvement, remediation or rehabilitation for vision or eye problems that have already developed (e.g. eye turn, shortsightedness, visual difficulties due to brain trauma etc).

We can help people with the following conditions:

- All Visual Problems
- Eye Turns
- Motion Sickness/Vertigo
- Autistic Spectrum Disorders
- Tunnel Vision/Depth Perception
- Anxiety & Spatial Organisation Issues
- Attention Deficit Disorders
- Learning Difficulties

All children should be checked at:

6 months of age • 2½ Years • Before starting school • Yearly thereafter

If you have one or more of the following signs or symptoms in this checklist, an assessment of your “whole” visual system is recommended. ↻

✓ CHECKLIST

- Problems with reading and learning
- Difficulty with physical activity and sport
- Blurred vision
- Intolerance to light
- Double vision
- Poor handwriting
- Reading slowly
- Eye turns
